

**Assignment 1: HTML**  
**CSCI 1170**  
**Part 1:**

My website is going to outline my current and future goals in both academics as well as future career goals. I would like the website to have a broader scope in terms of exact details but I'd like to focus on backend software development as well as data science. Ideally I'd like the website to be simple and clean, limiting clutter and utilizing space effectively.

The website will include 4 pages all including different info and features. The website will feature a home page with a brief intro to what the purpose of the website is and what its goals are. The second is an about me page, this page is going to be a little bit of info about myself personally. Ex. Family, Where I grew up, Etc.. The third page has the bulk of the content as it is the career page. It will include my current and future career goals. As stated previously the main focus is going to be on both data science and backend development, both of which will be separated into two distinct sections. This page will include info about each career path as well as relevant videos to the subject. The fourth and final page is a travel and photos page, this page will be strictly visuals, it will include photos and videos of places I've been and things I've done. While not necessarily relevant to the rest of the site, I think it adds a better aesthetic and gives the user something interesting to look at.
